

## Typar® HouseWrap

Typar® HouseWrap is made of a durable, spunbonded polypropylene that offers the perfect balance of strength, UV stability, air and moisture porosity and ease of use.

### Energy Efficiency

Typar HouseWrap covers construction gaps, cracks, leaks and holes to keep inside "conditioned" air in, and outside air out.

- Keeps a home warmer in the winter and cooler in the summer.
- Reduces air movement in wall cavities to help maintain the integrity of the insulation R-value
- Studies show Typar will save up to 25% in heating and cooling costs
- Average payback is achieved in less than 16 months

### Strength

A torn housewrap will not work, but Typar HouseWrap is strong enough to endure the elements and conditions on the construction site.

- Continuous and durable polypropylene filaments help ensure the fabric won't tear
- More tear resistant than the closest competitive brand
- Unconditionally guaranteed

### Ultraviolet Stability

It is sometimes impossible to schedule when the housewrap will be covered with siding, and if a housewrap doesn't have the UV stability, it won't be able to endure exposure to the sun.

- Typar has UV stabilizers built into the fibers, as well as in the coating, making it the most UV stable housewrap on the market
- Glare-resistant color minimizes glare and is installer friendly
- Attractive platinum color adds curb appeal during construction

### Moisture Vapor Transmission Rate (MVTR)

To be effective, a housewrap must allow the right balance of moisture vapor transmission to provide a more protected, comfortable home.

- Typar has a MVTR of 152gm/m<sup>2</sup>/24hr
- Allows a home to breathe, so there's no moisture build-up to damage the wall cavity

### Ease of Use

Typar HouseWrap was designed with builders and their crews in mind. It is easy to install.

- Convenient stud markings show where to nail to speed installation
- Easy to handle and cut
- Gets construction crews out of the weather faster to work inside
